

GOLF CLUB SCALE

by **Golfsmith**[®]

TOTAL WEIGHT

SWINGWEIGHT

Stock No. 14009

Your new *Golf Club Scale* has been developed from years of research and experimentation in our own golf clubmaking facility. The scale measures swingweight and total clubweight and is accurately factory calibrated before shipping. This is also one of the only scales on the market that doesn't require you to waste time trying to level, or extending it over the end of a table so it can be used. Simply place your scale on a flat surface, put the stainless steel weight on the track and you're ready to go.

OPERATION

To measure swingweight, simply place the butt end of the club in the vertical arm. extending the club along the scale. The shaft should rest in the notch of the opposite vertical arm. Slide the weight along the scale until the scale balances. The swingweight reading is taken from the clubhead side of the sliding weight.

To measure total weight, rest the club on the golf club cradle so that it lies perpendicular to the scale. Once again, slide the weight until the club balances, reading the club weight in either ounces or grams from the club side of the sliding weight.
